The 2019-2020 Coronavirus Pandemic Analysis

BACKGROUND & APPROACH

I wanted to track and trend the coronavirus outbreak on my own curiosity. There are some interesting questions that may fall out of this, as it is a very historic moment, including scientifically and analytically (we have a large amount of data being shared across the globe, analyzed in real-time). The world has come to a halt because of it.

This analysis attempts to answer the following questions (more to come):

- 1. What does the trend of the pandemic look like to date?
- 2. What are future case predictions based on historical model?
- 3. What interesting quirks or patterns emerge?

ASSUMPTIONS & LIMITATIONS: * This data is limited by the source. I realized early on that depending on source there were conflicting # of cases. Originally I was using JHU data... but this was always 'ahead' of the Our World In Data. I noticed that JHU's website was buggy- you clicked on the U.S. stats but it didn't reflect the U.S.. So I changed data sources to be more consistent with what is presented in the media (and Our World In Data has more extensive plots I can compare my own to). An interesting aside might be why the discrepancy? Was I missing something?

* Defintions are important as is the idea that multiple varibales accumulate in things like total cases (more testing for example).

SOURCE RAW DATA: https://ourworldindata.org/coronavirus

INPUT DATA LOCATION: github (https://github.com/sbs87coronavirus/data)

OUTPUT DATA LOCATIOn: github (https://github.com/sbs87coronavirus/results)

PRE-ANALYSIS

The following sections are outside the scope of the 'analysis' but are still needed to prepare everything

UPSTREAM PROCESSING/ANALYSIS

1. Google Mobility Scraping

```
# Mobility data has to be extracted from Google PDF reports using a web scraping script (python , writt
# See get_google_mobility.py for local script

python3 [get_google_mobility.py](https://github.com/sbs87/coronavirus/blob/master/get_google_mobility.py
# writes csv file of mobility data as "mobility.csv"

# TODO: customize get_google_mobility.py script, add arguments
```

SET UP ENVIORNMENT

Load libraries and set global variables

Q2: What is the predicted number of cases?

What is the prediction of COVID-19 based on model thus far?

Additional questions:

WHy did it take to day 40 to start a log linear trend? How long will it be till x number of cases? When will the plateu happen? Are any effects noticed with social distancing? Delays

```
##-----
## Prediction and Prediction Accuracy

CONCLUSION

Overall, the trends of COVID-19 cases is no longer in log-linear phase for world or U.S. (but some regions like MD are still in the log-linear phase). Mortality rate (deaths/confirmed RNA-based cases) is >1%, with a range depending on region. Mobility is not a strong indicator of caseload (U.S. data).

See table below for detailed breakdown.

Question	Answer
What is the effect	There is not a
on social	strong apparent
distancing,	effect on decreased
descreased mobility	mobility (work,
on case load?	grocery, retail) or
	increased mobility
	(at residence,
	parks) on number
	of confirmed cases,
	either as a country
	(U.S.) or state level
	California appears
	to have one of the
	best correlations,
	but this is a mixed
	bag
What is the trend	The confirmed
in cases, mortality	total casees and
across	mortality is overall
geopgraphical	log-linear for most
regions?	countries, with a
	trailing off
	beginning for most
	(inlcuding U.S.).
	On the state level,
	NY, NJ, PA
	starting to trail off;
	MD is still in
	log-linear phase.
	Mortality and case
	load are highly
	correlated for NY,
	NJ, PA, MD. The
	mortality rate
	flucutates for a
	given region, but is
	about 3% overall.

Cheatsheet: http://rmarkdown.rstudio.com> # TODO * mkdir the results dir if it doesn't exist * make ggplot a dependency for plot.utils?

* automated way of downloading daily data * fix plot_utils, add dataset and documentation * Auto git mv the new data?

Sandbox

##TOD0:

Geographical heatmap!

```
install.packages("maps")
library(maps)
library
mi_counties <- map_data("county", "pennsylvania") %>%
    select(lon = long, lat, group, id = subregion)
head(mi_counties)

ggplot(mi_counties, aes(lon, lat)) +
    geom_point(size = .25, show.legend = FALSE) +
    coord_quickmap()
mi_counties$cases<-1:2226
name_overlaps(metadata,Corona_Cases.US_state)

tmp<-merge(Corona_Cases.US_state,metadata)
ggplot(filter(tmp,Province.State=="Pennsylvania"), aes(Long, Lat, group = as.factor(City))) +
    geom_polygon(aes(fill = Total_confirmed_cases), colour = "grey50") +
    coord_quickmap()</pre>
```
